

Environmental Concerns

- High-nutrient, bacterial, and salinity levels—along with low dissolved-oxygen levels—in some Texas watersheds have raised concerns among residents and state officials about public health, water quality, water-use limitations, aquatic habitats, and reduced or lost recreational opportunities.
- Potential sources of this pollution include natural sources, feral hogs, wastewater treatment systems, livestock and pet waste, and fertilizer and chemical runoff from croplands, pastures, lawns, landscapes, parks, and industrial sites.

AgriLife Extension's Response

The Texas A&M AgriLife Extension Service has collaborated with many local, state, and federal agencies and organizations to inform and educate residents about water quality concerns in several Texas watersheds.

- AgriLife Extension currently coordinates planning and education efforts in the following watersheds: Attoyac Bayou, Copano Bay, Mission River, Aransas River, Matagorda Basin, Lavaca River, Tres Palacios Creek, Arenosa Creek, Carancahua Bay, Little River, San Gabriel River, Big Elm Creek, Navasota River, Arroyo-Colorado River, Mill Creek, and Geronimo and Alligator Creeks.

- The process of improving water quality and protecting a watershed's natural resources typically involves forming a local stakeholder partnership group, identifying the causes of watershed pollution, and developing a comprehensive management plan. Education and the adoption of best management practices are critical to implementing these efforts.
- Through more than 70 educational events, watershed planning meetings, and workshops in 2015, AgriLife Extension and collaborating agencies engaged more than 2,300 landowners and other stakeholders in an effort to improve public awareness and participation vital to developing and implementing watershed protection plans.

Economic and Environmental Impacts

The following highlights demonstrate recent accomplishments made toward restoring water quality through selected watershed protection and education programs:

- While efforts to protect watersheds and restore water quality are in various stages, significant progress is being made. In 2011, the Plum Creek Watershed became the first watershed to be removed from EPA's list of impaired water bodies. Water quality has also been restored in the Buck Creek Watershed.
- To leverage state resources, \$5.7 million in externally funded grants over five years has been obtained to support critical water quality protection activities, identify sources of watershed contamination, and support educational programs.
- These grant-leveraged projects for improving water quality support an additional 62 jobs, with an annual wage base of \$1.5 million.
