Plant of the Month

Guajillo , Guajillo Acacia

Acacia berlandieri Benth.

Fabaceae (Legume family)

Plant Description:

Guajillo is a nearly thornless shrub to small tree in the Legume family. The plant height varies greatly, but it can grow up to 15 feet or 4.6 m tall. Guajillo leaves are arranged like those of mesquite, having a fern-like appearance, but are smaller. The sweet-scented, white to yellow flowers are ball-shaped and clustered in dense groups. The plant produces a flattened, bean-type legume fruit that is four to six times longer than it is wide, containing dark, brown seeds. The forage value of Guajillo is poor for livestock and wildlife except under drought conditions. However, it may be toxic when consumed as a major part of the diet.

Habitat:

Guajillo grows on a variety of soil types but is most prolific on ridges and shallow soils. Found mainly in the South Texas Plains and southwest Texas, it is less common in the southern Edwards Plateau and Trans-Pecos regions. It also grows extensively in northern Mexico.

Toxic Agent:

Guajillo poisons sheep, goats, and possibly cattle. The leaves contain excitatory amines, principally N-methyl-β-phenethylamine and tyramine. Overconsumption may cause a condition in sheep and goats known as Guajillo wobbles, which may be followed by death. The lethal dose of plant material for sheep and goats has not been determined. The toxic dosage is 15 times the animal's weight in leaves and fruit consumed over several months.

Plant Characteristics:

- Flower Color:** White, Yellow
- Fruit Type:** Bean/Pod
- Duration:** Perennial
- Stem Texture:** Hairless/Smooth
- Growth Habit:** Shrub (Woody)
- Season:** Warm

Texas Parks and Wildlife Department Browse Plant Description:

Guajillo

Crude Protein: 17-28%

Small-to-medium shrub with multiple stems; small, slightly recurved to straight thorns; twice compound leaves are narrow, delicate and fernlike; white to yellowish fragrant flowers; legumes have broad seeds.

TEXAS BEEF QUALITY ASSURANCE

BQA TIPS

Smart Phosphorus Use in Pastures and Hayfields

July 1, 2025
Emily Lochner

Nitrogen, phosphorus, and potassium also referred to as N, P, and K are primary nutrients plants need for growth. Grasses require much more nitrogen and potassium than they do phosphorus.

Very little phosphorus is removed by cattle grazing. While more phosphorus is removed with a hay crop, the amount is still small compared to nitrogen or potassium.

From both an economic standpoint and an environmental stewardship perspective phosphorus should not be applied to pastures or hayfields without a soil test. A soil test from a few years make is generally sufficient to establish if any phosphorus should be applied.
