MCJLS Rabbit Validation

- Date: January 5th
- Time: 4:30-6:30pm
- Location: Extraco Show Pavilion- Glass Room
- Cost- 50 cents per bunny
- Details- **All meat pen rabbits** must be validated at this time to become eligible for the 2026 McLennan County Junior Livestock Show held in February.
 - **NO BREEDER RABBIT VALIDATION IS REQUIRED.**

McLennan County Jr. Livestock Show 2026 Schedule

| | Monday Feb. 2 nd | Tuesday Feb. 3 rd | Wednesday Feb 4 th | Thursday Feb. 5 th | Friday Feb. 6 th |

Tips for clipping market animals for the county show

Managing a slick steer seems fairly straight forward and it is the little things that one does can make a difference in order to get that velvet looking presentation it still takes lots of elbow grease and work prior to the show. I encourage exhibitors to ask those around that have been successful in slick shear steers for their opinion and even if they have little tricks of the trade which they would be willing to share. I always recognized that there is room to learn and that there are several different methods used to accomplish a goal. I feel like there are three basic steps to pay attention to when managing a slick shorn show steer.

Step 1: Hair Coat Management Prior to Slicking

Step 2: Slick Shearing (The process of)

Step 3: Hide and Hair Coat Management 10 days prior to the.

Step 1: Hair Coat Management Prior to Slicking

I am a firm believer that regardless if you have a steer that is going to show with hair or without it you have to take time to rinse and work the hair. This process needs to start from the time you get the calf to the time of the show. This will allow the hide and hair of the calf to be well conditioned, and it also requires the exhibitor to work with the steer on a daily basis which helps with the calf's temperament. If possible rinse the calf daily, and when washing use a gentle soap and conditioner. I suggest washing and conditioning at least two to three times a week if weather and time allow. When working hair use a comb, rice root, and or wash brush and a blower when needed and don't forget working hair doesn't mean just brush it one direction and stop; it means brush, brush and brush.

In addition to washing, conditioning, and working hair it is imperative to implement a good vaccination program and utilize topical pour-ons to ensure the calf doesn't get lice. All these things will help in the process of getting that hide and hair to look its best.

Step 2: Slick Shearing

The process of actually slick shearing a steer is fairly simple, but timing of it and making sure to get all the hair removed from all locations of the body with the exception of the tail and switch is perhaps the most challenging part. I would suggest shearing the steer for the first time about ten days prior to the show, and use a type of flathead clipper. Go up with the clippers against the grain of the hair with long fluid strokes all over the body. I utilize a smaller type of clipper to get the legs, behind the dew-claws, in and around the ears, and any areas that are more challenging to get to.

After the first time of shearing the steer I would suggest that you make sure the calf stays out of the sun during the day, especially if it is light colored. This will ensure that the calf doesn't get sunburned.

I usually go back over the calf one more time prior to leaving for the show and make sure to check for any hair that might have been missed. The Texas show rules state that the hair coat on the calf cannot be more the 1/4 of an inch anywhere on the body with the exception of the tail and switch, which can not be any longer than 10 inches from the bottom of the tail bone. To make sure you are measuring correctly, you can take the tail and at the base of the tail feel for the end of the bone, and measure 10 inches up from this point, and this is how far down the tail you must slick. This will be monitored by officials at the shows during check in and or classification. In the event that you are going to show at several slick shows with the same calf you need to make sure and go over the steer prior to each show. The hair will grow back and it may become longer than the allotted 1/4 inch hair length.

Step 3: Hide and Hair Coat Management 10 days prior to the show.

After shearing the steer it is very important to condition and manage the hide and coat of the steer. At this point you are a week out from the show, and daily management is a must. I would suggest washing the steer daily with a mild soap and utilize a conditioner such as Mane and Tail on the hide.

After washing use a chamois rag to dry the steer off and liberally apply the conditioner on the hide using your hands and a soft brush. Let the conditioner set and rinse that evening and apply some sort of sheen.

I would suggest repeating the process each day prior to leaving for the show. While at the show the same process should occur, but it is important to remember that prior to entering the show ring the steers are towed and therefore no product should be on the hide, as per the rules.

The only thing I would do to the steer on show morning would be to wash the calf, dry with a rag, brush with a soft brush, and hit the ring. The prep work prior to this should give you that sheen and look of a well-managed show steer. The rest is up to the judge and luck. Whether you win or lose showing a steer, I think it is important to remember that success at anything takes hard work, skill, knowledge, and yes, some luck. This holds true for whatever you do and showing livestock in 4-H and FFA serves as a great platform and educational tool.

Tips for clipping market animals for the county show

Goats- Steps to shearing:

1) Blow out all of the dirt from the body with a blow dryer. Note: Goats do not like water. We do not generally wash the goats unless they are extremely dirty or muddy. We manage skin and hair daily by keeping the goats in a clean pen with a light weight blanket. We catch the goats daily, put them on a table and blow out their hair to clean the hair and hide. Apply a light coat of Show Sheen to condition the hair. Brush the hair with a soft brush to work in the conditioner and train the hair.

- 2) Secure the goat on a trimming table.
- 3) Shear the goat- I like to start at the rear hock and shear up towards the back. Repeat for the front leg- knee up to the back. Shear the back and sides forward from the tail to the neck. Shear the neck from the shoulders and brisket- up and forward towards the head. Shear the inside of the back leg from the hock up. Shear the underline to include between the front legs. Shear the head last. Hair will be left on the legs from the hock/knee down and the tail.
- 4) Next you will blend the hair left on the legs into the rest of the body, this can be done with a smaller clipper.
- 5) Trim the hair around the hoof line on each leg.
- 6) Block out the tail.
- 7) Apply a skin conditioner.
- 8) Blanket or sock the goat.
- 9) Return to a clean and dry pen.

Helpful hints:

- Make sure your goat has been on a shearing table and has been sheared several times prior to shearing for the show. Practice makes perfection.
- I like to shear with Lister or Premier covercoat blades the day before the show. Do not shear the day of the show. The goat will get tired and you will normally have clipper tracks in the hair coat.
- Freshly sheared goats can sunburn easily. Put on a sock or blanket or keep the goat out of the sunlight. Animal sun-block products can also be used and are available at your local feed store.

Sheep- Fitting involves preparing the lamb for the show. The first item of importance is to acquire a copy of the rules for the stock show you are planning on attending and read the rules concerning the fitting of the lambs. The majority of the shows require that the lamb be slick sheared from the hocks/knees up.

Shearing- as it may sound simple, shearing methods will differ among exhibitors. I like to experiment ahead of time to find the right procedure to use. For those that show at a lot of prospect shows, practice makes perfect and they will know what works the best.

Helpful hints:

- Lambs do not like water. Take your time and be gentle when washing and do a thorough job of getting the lamb clean and rinsing out all of the soap. Do not get water in the Lamb's ears.
- Make sure your lamb has been on a shearing table and has been sheared several times prior to shearing for the show. Practice makes perfection.
- Do not shear the day of the show. The lamb will get tired and you will normally have clipper tracks in the hide.
- Freshly sheared lambs can sunburn easily. Put on a sock or blanket or keep the lamb out of the sunlight. Animal sun-block products can also be used and are available at your local feed store.
- Shear with both fine blades and surgical blades at home while practicing to see which blade provides the best "handle". Do not wait until the show to determine which blade you should use. All lambs "shear out" different. Do your homework.

Steps to shearing:

- 1) Wash the lamb with a mild livestock shampoo and rinse. Repeat.
- 2) Apply a conditioner, let set and rinse.
- 3) Towel dry the lamb
- 4) Secure the lamb on a trimming table.
- 5) Shear the lamb- I like to start at the rear hock and shear up towards the back. Repeat for the front leg- knee up to the back. Shear the back and sides forward from the tail to the neck. Shear the neck from the shoulders and brisket- up and forward towards the head. Shear the inside of the back leg from the hock up. Shear the underline to include between the front legs. Shear the head last. Wool will be left on the legs from the hock/knee down.
- 6) Block the leg wool
- 7) Rinse the lamb.
- 8) Apply a skin conditioner
- 9) Blanket or sock the lamb
- 10) Return to a clean and dry pen

Diagram 1. Direction of slick shearing strokes.

Proper nutrition, hair and skin care and exercise are important to getting your show pig prospect ready for the next show. But don't forget about clipping your pig. Clipping your pig can change the pig's appearance and accentuate its muscularity, leanness and balance.

How to Clip the Body of Your Show Pig

Clipping the body of your pig is crucial to make your pig look its best. Clipping will make them look like a show pig and give them the presentation that will appeal to the judge on show day.

Check the rules and choose the right guard.

It's important to clip the body of your pig evenly and at the proper length. Some shows have rules about hair length, so always check your show rules before clipping your pig. Once you know the rules you'll need to select the right length of guard and the appropriate clipper blade. It is suggested to use a number 10 clipping blade and either a 1A or 2 Oster Red Speed O Guard to clip the body of your pig.

Keep the guard flat and clip against the hair.

When clipping the body, your goal should be a smooth and even hair coat. Using the clippers properly will ensure your job comes out even when you're finished. Keep the guard flat to the surface of the pig's body and clip directly against the hair. Start at the rear of the pig and work your way forward one pass at a time, to be sure you don't miss any spots. Since the head and body might be clipped at different lengths, we also need to blend the neck area from the shoulder to the head to balance your clipping job.

Blend the neck.

Blending the neck starts at the front side of the shoulder, using the same guards you clipped the body with. Then as you move forward towards the head, continue to go down one guard size at a time till you reach the head. Remember it may take more than one pass per guard; the goal is to end up with the same guard or length you used on the head when you reached the backside of the jaw.

Clipping the Head & Ears

Once you clip the body of your show pig you need to clip the head, ears and underline. This will highly improve your pig's look and appearance. It is going to be easiest to clip these areas if your pig is lying comfortably. Have someone help you your pig's belly until it is comfortably lying on its side. Then start by brushing its face before you begin clipping. This will be much less stressful for your pig than snaring. Teaching your pig to lay down when you scratch its belly will make jobs like clipping much easier.

Clipping your pig's head and ears adds polish to your clipping job, and will give the pig a much more youthful appearance. When clipping the head you'll go against the hair using a shorter guard such as a00 Oster red Speed-O-Guide. Even the most youthful pig will often have long hair in and around its ears. When clipping the ears you don't need a guard. Your main focus should be along the edges of the ear, trimming the long hair to make it even. You'll also want to clip any long hairs on the inside and outside of the ear.

Clipping the Underline

Clipping the underline is the final part of getting the show ring ready look. The underline is considered any part of the chin, throat, chest and belly, as well as the seam of the ham. One way to clip the underline hair short is using a technique called back dragging. With no guard attached, turn your clippers over and drag your blades with the hair. Any wild hairs need to also be taken off. Remember, no matter how tempting it may be, do not clip any hair off the legs or tail.

Check for wild hairs.

To ensure the clipping job is perfect you'll want to make sure you didn't leave any stray hairs, or create any uneven places on the body. Always do a final review by brushing your pig's hair correctly to make sure you don't have any wild hairs or uneven spots. Following these simple steps to finish the detail work will get your pig looking its best on show day.

5 common questions surrounding supplements

By: Mari Morris, National Support Specialist

Supplements are designed to be added to a feed program to affect specific areas of animal development, where a complete feed takes a more general, nourishing approach. They can be beneficial tools when used correctly. There is a supplement for everything these days, whether you need to add muscle, fat, rib fill, body depth, structural or hair development. But with so many options, it can be hard to know what to feed, when to feed it and how much to feed. We address five of the most common questions surrounding supplements in the discussion below.

1. When should I start supplements?

Before starting supplements, every project should have a good base feed and established eating habits. When they are ready to start supplementation, your animal will tell you or, more realistically, show you. What we mean by that is that when you begin to see some flaws in your project, start thinking about how to fix those flaws. We want to start supplements early enough to make a change, and we need to use them long enough for them to do their job and work. We can see a difference as soon as 7–14 days with more aggressive supplements, but others need 30–60 days. So, the best approach to this is to start supplements at least 60 days out from show.

2. What supplement should I be using?

As we said in the introduction, the number of supplements out there can be overwhelming. That makes answering this question difficult. But the answer lies within the animal itself. What weaknesses are he/she exhibiting? What flaws do we need to try and compensate for or fix?

- If bloom and fat cover are the issue, we would look toward adding more energy into the diet
- If we need to develop muscle tone, dimension and mass, we would look at higher protein products. These protein products range from 20–40% protein; anything higher than that will not only shape muscle but it will aggressively burn fat.
- If you want to burn fat, we would recommend high protein products
- If your project is too tight-ribbed, we would recommend you try high fiber products
- If your animal needs help breathing or enhancing stamina, Exhale is the answer.

3. How much of the supplement should I feed?

Always be sure to follow label instructions on the product regarding feeding directions. Second, be sure to weigh the feed and supplements you are using. Do not rely on the container size or coffee can to measure. When reading the labeled feeding directions of a product, you may see a range. These ranges are given for a reason, not to cause you confusion. For example, it may say to feed 4–8 ounces of a product. The lower end of this range (4 ounces) is recommended for animals who need moderate help in this targeted area. The higher end of the range (8 ounces) is recommended for animals who need more aggressive help in the area. You can always feed in-between the range (6 ounces) if you are unsure where your animal falls.

4. How do I know if a supplement is working?

You should be able to see or feel (by handling) a change in your project. If this is hard for you to determine with daily monitoring, take a picture before starting the supplement and again in 14–30 days. You should be able to see a change between the two. If you are not seeing desired results after 30–45 days, here are some things to consider:

- Can you increase the rate without going off-label?
- Maybe your project needs a more aggressive dose of the product.
- Ask yourself or a resource, like a feed representative, if you are using the correct product.

5. When do I stop using a supplement?

Many people want to stop using a supplement once they have achieved the desired results, and sometimes, depending on the product or goal, that can work. But most of the time, the animal will still need a reduced amount of that product, or another product, to maintain the desired results since they were not genetically inclined to have this trait in the first place. If you are feeding a fat supplement, you can typically pull the product when the optimal fat level has been achieved. However, if you are using a product for rib fill or muscle shape, you may need to continue feeding that product to maintain results. We typically recommend reducing the amount being fed and monitoring to see if the desired results remain. Or it may be time to switch supplements. In conclusion, supplements can be a tricky game to play but extremely beneficial. They have the power to take your animal to the next level. Let your animal tell you what they need, identify the supplement that fits their needs best, follow labeled feeding directions and watch the product work its magic.

Houston Livestock Show

- Entry fee increase on all species
- No Health Certificates required for all Jr Show entries
- Jr. Gilts will add Hereford breed
- Show Indemnity form is multiple pages and will require additional signatures

San Antonio Livestock Show

want to inform our Commercial Steer Exhibitors of a minor change for the initial and final weigh period along with the postmark date for your record book.

-All exhibitors in this division must have owned and had their steers on feed on or before August 29, 2025.

Initial Weight: August 22 - August 29, 2025

Final Weight: January 23 – January 30, 2026

-We will be increasing the "Above Weight Target" to 1650 lbs. to adjust to industry trends. Point deductions will be adjusted accordingly as well.

**Note: The scale tickets must show both steers were weighed on the same day or points may be deducted.

-Record Books must be completed and mailed by UPS or FedEx by February 6, 2026 to the San Antonio Stock Show & Rodeo Competitive Events Office (3201 E. Houston Street San Antonio, Texas 78219)

Additional SALE Show Updates

- Jr. Gilts only allowed 2 entries for 2026
- Hereford Gilts eligible for scholarship this year
- Mkt Lamb Sale spot adjustments- downs- 5 classes/1st-7th Dorper- 3 classes 1st – 6th MW- 15 classes/4 divisions/ 1st – 9th (7th – 9th non- walking lots)
- Mkt Swine- NEW Light Crossbred Breed division in Wave 2 this breed will also be eligible to receive a \$10,000 scholarship this year
- Mkt Swine Sale Slot update- Light Cross- 6 classes/ 1st- 4th Crossbred -8 classes/ 2 divisions/ 1st- 6th Reminder: 5th & 6th places are non-walking lots in the Junior Market Barrow Auction
- Associate Judges added for Market Lambs & Market Goats
- Mkt Steers- Wave 1 class outs will have the opportunity to reclaim their show weight prior to Wave 2 check in deadline
- Commercial does & Market Goats- must be shorn with no indications of blocking to no more than $\frac{1}{4}$ " on all body above the knee & hock joint.
